

Medical Records & Task Management

> Relevant source files

This document covers the medical records management system and healthcare task scheduling functionality within the MKTY Smart Healthcare System. This subsystem enables patients and doctors to manage medical records, track important healthcare tasks, and leverage AI-powered analysis for medical workflow optimization.

For AI-powered medical consultation features, see [Medical Consultation System](#). For community features and knowledge management, see [Community & Knowledge Platform](#).

Overview

The Medical Records & Task Management subsystem consists of two primary components:

1. **Medical Records Management** - Comprehensive system for creating, viewing, and managing patient medical records with role-based access control
2. **Important Task Lists** - Healthcare workflow management with scheduling, prioritization, and AI-powered analysis

System Architecture

Component Architecture

`frontend/src/components/modules/MedicalRecordOverview.vue` 1-733

`frontend/src/components/modules/MedicalRecordInner.vue` 1-880

`frontend/src/router/index.js` 83-97

Data Flow Architecture

Sources: `frontend/src/components/modules/ImportantList.vue` 121-200
`frontend/src/components/modules/MedicalRecordOverview.vue` 198-211
`frontend/src/components/modules/MedicalRecordInner.vue` 258-283

Medical Records Management

Core Components

The medical records system is implemented through three main Vue components:

Component	Route	Purpose
<code>MedicalRecordOverview.vue</code>	<code>/main/MedicalRecordOverview</code>	Lists all medical records accessible to the user
<code>MedicalRecordInner.vue</code>	<code>/main/MedicalRecordInner</code>	Displays detailed medical record content
<code>MarkdownEditorComponents.vue</code>	Embedded	Provides rich text editing for medical record content

Access Control System

The system implements role-based access control with three user types:

Sources: `frontend/src/components/modules/MedicalRecordOverview.vue` 182-196

`frontend/src/components/modules/MedicalRecordInner.vue` 221-236

Medical Record Data Structure

Medical records contain the following key fields as processed by the frontend components:

Field	Type	Description
<code>medrecId</code>	Number	Unique medical record identifier
<code>medrecAbstract</code>	String	Brief summary of the medical record
<code>medrecContent</code>	String	Full medical record content (Markdown format)
<code>medrecState</code>	Number	Record status (0=active, 1=recovered, 2=chronic)
<code>medrecCreateTime</code>	Unix Timestamp	Record creation time
<code>medrecModifyTime</code>	Unix Timestamp	Last modification time
<code>patientName</code>	String	Associated patient name
<code>doctorName</code>	String	Responsible doctor name

`frontend/src/components/modules/MedicalRecordInner.vue` 247-250

AI-Powered Medical Analysis

The `MedicalRecordInner.vue` component integrates with the MKTY-3B-Chat model to provide intelligent medical analysis:

Sources: `frontend/src/components/modules/MedicalRecordInner.vue` 347-425

Task Management System

Important List Component

The `ImportantList.vue` component provides comprehensive healthcare task management with the following features:

Task Data Structure

Each medical task contains the following properties processed by the `il_pageLoad()` method:

Field	Type	Description
<code>listItemId</code>	Number	Unique task identifier
<code>listItemContent</code>	String	Task description

Field	Type	Description
listItemTimeMode	Number	Task type (0=one-time, 1=weekly, 2=no time requirement)
listItemIsFinished	Number	Completion status (0=incomplete, 1=complete)
listItemPriority	Number	Priority level (0=normal, 1=urgent)
listItemStartTime	Unix Timestamp	Task start time
listItemEndTime	Unix Timestamp	Task end time
listItemTimeWeek	Number	Weekly recurrence day (1-7)

Sources: frontend/src/components/modules/ImportantList.vue 121-200

Task Time Status Logic

The system implements intelligent time status calculation in the il_pageload() method:

Sources: frontend/src/components/modules/ImportantList.vue 172-194

Task Management Operations

Core task operations are implemented through dedicated methods:

Method	Purpose	API Call
il_addItem()	Creates new medical task	addImportantItem()
il_deleteItem()	Removes existing task	deleteImportantItem()
il_finishItem()	Marks task as completed	finishImportantItem()
il_pageload()	Loads and processes task list	getImportantList()

Sources: frontend/src/components/modules/ImportantList.vue 201-246

AI Task Analysis

The system provides intelligent task analysis through the `il_aiAncillaryAnalysis()` method:

Sources: `frontend/src/components/modules/ImportantList.vue` 247-298

Email Communication System

The task management system includes doctor-patient communication through the `il_sendEmail()` method:

- Markdown editor integration via `MarkdownEditorComponents`
- HTML email content generation
- Email title and receiver configuration
- Integration with backend email service

`frontend/src/components/modules/ImportantList.vue` 507-532

User Interface Patterns

Responsive Design Implementation

Both medical records and task management components implement responsive design patterns:
