

User Interface Components

> Relevant source files

This document covers the shared UI components, visual elements, and component architecture patterns used throughout the MKTY Smart Healthcare System frontend. It focuses on reusable components, navigation structures, branding assets, and the integration patterns with the Element Plus UI framework.

For information about specific feature modules like medical consultation interfaces, see [Medical Consultation System](#). For authentication and user management interfaces, see [Authentication & User Management](#).

Component Framework Architecture

The MKTY frontend is built on Vue 3 with Element Plus as the primary UI component library, providing consistent design patterns and accessibility features across all modules.

Error Handling Components

The system implements standardized error handling through dedicated Vue components that provide consistent user feedback across all application modules.

NotFound Component

The `NotFound` component handles 404 errors and provides navigation back to the main application.

The component uses Element Plus's `el-empty` for the empty state visualization and `el-button` for the navigation action. The `GotoHomePage` method utilizes Vue Router's programmatic navigation.

Visual Assets and Branding

The system maintains consistent branding through standardized visual assets and iconography that reinforce the MKTY healthcare identity.

Branding Asset Structure

Asset Type	File Location	Purpose
Primary Favicon	<code>image/favicon.ico</code>	Browser tab icon
SVG Logo	<code>image/mkty_favicon.svg</code>	Scalable brand mark
Carousel Images	<code>frontend/public/images/homepage_carousel/</code>	Homepage visual content

Homepage Carousel System

The homepage implements a visual carousel system with medical-themed imagery to establish the healthcare context.

Component Organization Patterns

The frontend follows Vue 3 Composition API patterns with Element Plus integration for consistent component behavior and styling.

Standard Component Structure

Element Plus Integration Pattern

The system leverages Element Plus components consistently across modules:

Element Plus Component	Usage Pattern	Purpose
el-empty	Error states, no-data scenarios	Empty state visualization
el-button	Actions, navigation	User interaction triggers
el-form	Data input, authentication	Form handling
el-table	Data display	Tabular data presentation

Element Plus Component	Usage Pattern	Purpose
e1-card	Content grouping	Visual content containers

Navigation Architecture

The application uses Vue Router for declarative navigation with programmatic routing methods integrated into component logic.

Router Integration Patterns

Navigation methods in components follow consistent patterns for route transitions and user flow management:

- Method naming: `Goto[Destination]` pattern
- Router usage: `this.$router.push(path)` for programmatic navigation
- Route paths: Consistent `/main/[Module]` structure

Styling and Layout Standards

The component styling follows scoped CSS patterns with consistent layout principles for healthcare application usability.

Layout Principles

Principle	Implementation	Purpose
Full Viewport Usage	height: 100vh	Maximize screen real estate
Consistent Backgrounds	Standardized color palette	Visual coherence
Accessible Typography	Element Plus typography	Readability standards
Responsive Design	CSS Grid/Flexbox patterns	Multi-device support

Component-Specific Styling

The NotFound component demonstrates the standard styling approach:

```
#NotFound-MainDiv {
  height: 100vh;
  background-color: rgb(210, 210, 210);
}
```

This pattern ensures full-screen error states with consistent background treatment.
